

Nadezhda Biziukova, PhD, is a researcher at the Laboratory of Big Data Analysis for Digital Pharmacology, Institute of Biomedical Chemistry, Moscow, Russia. Her research focuses on biomedical text mining, knowledge extraction from scientific literature, and computational approaches to digital pharmacology. She develops methods for biomedical entity recognition and normalization, relation extraction, evidence aggregation, and the generation of structured data from scientific publications. Her research has included literature-based studies of drug repurposing and pharmacological effects, virus-host-drug interactions, and molecular associations involved in signaling pathways. She is currently developing and improving Litbiome, an integrated web service for biomedical text mining and the extraction of traceable, structured knowledge from scientific literature.
